Should I update to MacOS 10.15 Catalina?

A new version of MacOS was released on 10/7/2019. Some major changes are included in this version, most impactful being the lack of support for 32bit applications. This means any application that is 32bit will no longer work when updated to MacOS Catalina. It's tempting to jump to the new version of technology when they are made available. The below guide will explain how you can check for any installed 32bit applications on your Mac device:

The below process will present you with a list of 32bit applications currently installed on your Mac device. If there is something on this list that you need or use regularly, please be sure there is an updated version of that application available that is supported on MacOS Catalina before updating your Mac device.

1) On your Mac, select the Apple menu in the top left corner of the desktop.

2) Select About This Mac.

3) Select System Report.

4) In System Report, scroll down to Legacy Software. This should present you with a list of all your installed 32-bit apps.
